

Snabbbit: ₹50 Lakh IPL Metro Blitz

6-Month Full-Funnel Google Ads Performance Marketing Media Plan (**March – August**)

Shubhi Saini | Head of Performance Marketing

Executive Summary & The Problem Statement

Brand Context

Snabbitt delivers **instant, on-demand househelp** across Top 5 Tier-1 Metros — Mumbai, Bengaluru, Delhi-NCR, Pune, Hyderabad.

10-minute response time. **₹99/hr** pricing. Operational supply: fully ready.

The Gap

Brand awareness is near zero. Supply is ready.
Demand must be manufactured.

The Opportunity

IPL season creates a **massive, predictable demand spike** for domestic chore help — match screenings, house parties, and post-event cleanup all trigger urgent househelp searches across metros. A ₹50 Lakh war chest, deployed with funnel precision across Google's full ad stack, can convert this seasonal chaos into **habit-forming ₹99 repeat bookings**.

Three Core Pillars

Awareness

Build brand recall across Top 5 metros during peak IPL viewership

Installs

Drive app installs at scale through Search & PMax capture

Retention

Lock in repeat ₹99 paid bookings & long-term habit formation

Channel Allocation Overview: 55% Conversion vs 45% Creation

The strategic philosophy: spending on awareness alone won't generate revenue. Allocating ₹27.5L to Search/PMax guarantees we capture active emergency intent while YouTube & Demand Gen feeds the top of funnel — a deliberate, full-funnel architecture.

55% — Bottom-Funnel Conversion Engine

Search (30%) + Performance Max (25%) — Captures active emergency intent at the moment users need help most. Every rupee here is accountable to a CPA.

35% — Top-of-Funnel Demand Creation

YouTube (20%) + Demand Gen (15%) — Builds mass awareness & IPL-season recall. Feeds branded search volume so conversion campaigns have intent to capture.

10% — Low-Cost Retargeting & SKU Visibility

Display (5%) + Shopping SKUs (5%) — Visual presence on cricket apps (Cricbuzz) & cart recovery for users who dropped off mid-funnel.

📌 Total budget: ₹50,00,000 across 6 channels over 6 months (March–August)

Channel Budget Matrix: **Primary Growth Drivers**

Three channels form the core revenue engine — Search locks intent, PMax scales AI-powered cross-channel reach, and YouTube builds the brand mass that makes both channels more efficient over time.

Search Ads — ₹15,00,000 (30%)

4 Campaigns | Bidding: tCPA / Max Conversions

Captures high-intent emergency chore & maid replacement searches at the exact moment of need. Exact + Phrase match dominates spend to eliminate waste. Priority geo: all 5 metros, pin-code level.

Performance Max — ₹12,50,000 (25%)

5 Geo-Segmented Campaigns | Bidding: Max Conversions / tCPA

Cross-channel AI scaling across Search, Maps & YouTube simultaneously. Optimized for ₹99 trial bookings. Each of the 5 metros receives its own PMax campaign to isolate learnings and CPAs.

YouTube Ads — ₹10,00,000 (20%)

3 Campaigns: Bumpers, In-Stream, Shorts | Bidding: Target CPM / CPV

Drives mass brand awareness & IPL match-day recall. 6-second bumpers for frequency; 15–30s in-stream for storytelling; Shorts for vernacular reach with younger metro audiences.

Channel Budget Matrix: Visual Nurture & SKU Channels

The supporting layer converts mid-funnel interest into action — Demand Gen uses lookalike audiences to find new users at scale, while Display and Shopping close the loop on engaged but unconverted users.

Demand Gen — ₹7,50,000 (15%)

2 Campaigns: Lookalikes & Custom Intent | Bidding: tCPA / Max Clicks

Visual carousel ads served across Google Discover, Gmail & Shorts feeds. Lookalike audiences seeded from existing installer data; Custom Intent targets competitor app researchers and home services query patterns.

Display Ads — ₹2,50,000 (5%)

2 Campaigns | Bidding: vCPM / tCPA

Visual presence on high-traffic cricket apps (Cricbuzz) and home services content. Primary function: retargeting users who visited the app but did not complete the booking funnel — a cost-efficient re-engagement layer.

Shopping / Service Feed — ₹2,50,000 (5%)

1 Service SKU Feed Campaign | Bidding: Target ROAS

Promotes packaged hourly service SKUs: **₹99 Express Clean, Party Cleanup, Post-Event Bartan**. Feed-based creative pulls dynamically, keeping ads highly relevant to the searcher's immediate need.

6-Month Flighting & Capital Pacing Strategy

Budget deployment is not uniform — it mirrors the IPL tournament calendar and monsoon seasonality to maximize ROI. **Front-load capital during peak cultural moments, then shift to efficiency-first retention.**

Phase 3: Jul–Aug

20% — ₹10.0 Lakhs

Retargeting & monsoon chore urgency. High maid absenteeism = Snabbit's organic hook. Drive repeat ₹99/hr subscription habits and long-term LTV.

Phase 2: May–Jun

35% — ₹17.5 Lakhs

Scale PMax & Search as brand recall peaks through IPL finals. Shift bidding from Max Clicks → Target CPA. Optimize toward bookings, not just installs.

Phase 1: Mar–Apr

45% — ₹22.5 Lakhs

Heavy YouTube & Search blitz during opening IPL weeks. Front-loads capital to capture peak tournament attention and maximize brand search lift from day one.

Phase 1  IPL Launch | Phase 2  Finals & Scale | Phase 3  Monsoon Retention

Search Keyword Match-Type & Budget Architecture

A disciplined match-type split ensures that the ₹15L Search budget balances **precision over high-value queries** with the AI signal-feeding required for Google's Smart Bidding to learn and self-optimize over the 6-month campaign window.

[Exact Match]

50% of Search Budget — ₹7.5 Lakhs

Locks in the highest-intent emergency queries with surgical precision. Zero wasted impressions. Every click is a user who typed the exact phrase Snabbit's service answers. Non-negotiable for protecting CPA in Phase 1.

"Phrase Match"

35% of Search Budget — ₹5.25 Lakhs

Captures urgent contextual phrases & city-specific query variations. Allows for natural language flexibility while maintaining intent alignment — e.g., "maid service in Bandra" or "emergency cleaning Koramangala."

Broad Match

15% of Search Budget — ₹2.25 Lakhs

Feeds Google Smart Bidding AI with voice searches, vernacular Hinglish variations, and emerging query patterns. Treated as a discovery layer — learnings flow back to tighten exact and phrase match lists.

❏ Negative keyword lists are maintained weekly across all campaigns to eliminate irrelevant serve and protect tCPA efficiency.

20-Keyword Blueprint: Emergency & Event Contextual

The first two keyword themes target the most commercially potent moments: the **absent-maid crisis** and the **IPL party aftermath**. Both trigger high-urgency, low-patience search behaviour — ideal conditions for Snabbit's 10-minute response proposition.

Theme 1: Urgent Absent-Maid (Emergency Needs)

Targets users in a genuine crisis moment — maid no-show, emergency clean, last-minute cook needed. Highest conversion intent of any keyword cluster. Dominate with Exact match.

[instant maid in 10 mins]

Exact Match — Core brand differentiator keyword. Bidding ceiling: premium.

"maid didn't show up today"

Phrase Match — Captures distress moment search with emotional resonance.

"emergency house cleaning service"

Phrase Match — Broad urgency signal; pair with rapid copy promises.

instant maid service near me

Broad Match — Voice-friendly query; feeds AI with mobile intent signals.

[cook maid on demand]

Exact Match — High-LTV user segment; cooking help = repeat daily need.

Theme 2: IPL Party Cleanup (Event Contextual)

Targets the post-match chaos window — 10PM–2AM on match nights. Google Ads scheduling rules activate this cluster only during IPL match slots for maximum CPM efficiency.

[after party kitchen clean]

Exact Match — Peak query: post-match, post-party, high urgency, high CPC tolerance.

"house party cleanup service"

Phrase Match — Evergreen social occasion trigger, not just IPL-limited.

"ipl match screening party maid"

Phrase Match — IPL-specific contextual keyword; seasonal budget spike in Phase 1.

utensil cleaning after party

Broad Match — Task-specific Hinglish-adjacent query; high volume, lower CPC.

[living room party clean]

Exact Match — Room-specific intent; pairs with Shopping SKU (Party Cleanup).

20-Keyword Blueprint: Vernacular & Conquesting

The final two themes capture India's linguistic reality and competitive landscape. **Hinglish queries are underserved by competitors** — owning this space means lower CPCs and higher relevance scores. Conquesting converts competitor intent directly.

Theme 3: Chore-Specific Hinglish (Native Vernacular)

Urban metro users think in Hinglish. These queries reflect real, spoken language — not sanitised English translations. Expected CPCs are 30–50% lower than English equivalents with comparable intent quality.

[jhadu pocha bartan help]

Exact — The holy trinity of Indian household chores in one query. Core Snabbit use case.

"bartan wali maid near me"

Phrase — Location-intent + vernacular = high-conversion micro-moment.

"urgent jhadu pocha service"

Phrase — Urgency modifier in Hindi; emotionally resonant with target audience.

part time maid for dishwashing

Broad — Task-specific, discovers long-tail variants for negative list refinement.

[hourly househelp service]

Exact — Directly anchors Snabbit's ₹99/hr pricing model in the query match.

Theme 4: Brand Defense & Competitor Conquesting

Two-pronged: **defend Snabbit's own brand terms** (competitors will bid on them) and **conquer users actively researching alternatives**. Conquesting ads lead with price and speed differentiators.

[Snabbit app]

Exact — Brand Defense. Prevent competitor conquest of our own brand SERP.

[Snabbit maid service]

Exact — Brand Defense. Capture direct navigational intent at lowest CPC.

"Urban Company maid alternative"

Phrase — Conquesting. User is actively evaluating options — lead with ₹99 price.

"BookMyBai instant maid"

Phrase — Conquesting. Target dissatisfied competitor users with speed messaging.

Snabbit booking ₹99

Broad — Branded price query; reinforces value prop to high-intent brand searchers.

Measurement Dashboard: Full-Funnel KPI Framework

Every rupee of the ₹50L budget is accountable to a specific metric tier. TOFU metrics validate awareness investment; MOFU metrics prove conversion efficiency; both feed into a **unified reporting dashboard reviewed weekly by the performance team.**

Top-of-Funnel (TOFU)

Channels: YouTube, Display, Demand Gen | Phase 1 Priority

Viewable CPM (vCPM) & Unique Metro Reach

Penetration benchmarked per metro. Target: 60%+ unique reach in Top 5 cities by end of Phase 1. Validates that awareness budget is reaching new users, not re-serving the same audience.

Cost Per View (CPV) & View-Through Rate (VTR %)

VTR% indicates creative quality and audience alignment. Low VTR% triggers immediate A/B creative refresh. CPV benchmarked against Indian YouTube category averages for home services.

Branded Search Lift

"Snabbit" direct query volume indexed against pre-campaign baseline. Measured post each major IPL match weekend — the single most reliable signal that YouTube spend is generating real brand memory.

Mid-Funnel (MOFU)

Channels: PMax, Search | Phase 2 Priority

Click-Through Rate (CTR %) & Impression Share

CTR% validates ad copy relevance against keyword clusters. Impression Share reveals budget sufficiency vs. competitor aggression — a share below 70% in Phase 1 triggers a budget reallocation review.

Cost Per Install (CPI) — Per Metro Pin-Code

CPI benchmarked at pin-code level, not just city level. Allows the team to identify high-performing micro-geos (e.g., Koramangala, Bandra West) and concentrate PMax budget for maximum efficiency.

Install-to-Sign-Up Activation Rate (%)

The critical bridge metric between marketing and product. A low activation rate (target: >40%) indicates an onboarding UX issue — not a media problem. Surfaced weekly to both marketing and product teams.

❏ CAC, ROAS, and CVR targets to be calibrated by the team after Phase 1 data collection (first 30 days).
